## 2. Protein purification

Figure S1. SDS-PAGE of purified proteins. M represents the Marker; Proteins shown correspond to А) 1: CYP154C5 (45.3 kDa); 2: CYP154C5 M84A; 3: CYP154C5 Q398A; 4: CYP154C5 Q239A; 5: CYP154C5 F92A and B) four different Pdx (11.5 kDa) batches; PdR ( 45.5 kDa ).

## 3. Biochemical characterization of CYP154C5 mutants

Figure S2. Substrate-binding titrations for CYP154C5 wild type using steroid substrates A: pregnenolone (1), B: dehydroepiandrosterone (2), C: progesterone (3), D: androstenedione (4), E: testosterone (5) and $\mathbf{F}$ : nandrolone (6). $\Delta \mathrm{A}$ was plotted against the applied steroid concentration and the resulting data was fitted using the tight binding equation.

Figure S3. Substrate-binding titrations for CYP154C5 M84A using steroid substrates A: androstenedione (4) and B: testosterone (5). $\Delta \mathrm{A}$ was plotted against the applied steroid concentration and the resulting data was fitted using the tight binding equation.

Figure S4. Substrate-binding titrations for CYP154C5 F92A using steroid substrates A: dehydroepiandrosterone (2), B: progesterone (3), C: androstenedione (4) and D: testosterone (5). $\Delta \mathrm{A}$ was plotted against the applied steroid concentration and the resulting data was fitted using the tight binding equation.

Figure S5. Substrate-binding titrations for CYP154C5 Q239A using steroid substrates A: pregnenolone (1), B: dehydroepiandrosterone (2), C: progesterone (3), D: androstenedione (4), E: testosterone (5) and $\mathbf{F}$ : nandrolone (6). $\Delta \mathrm{A}$ was plotted against the applied steroid concentration and the resulting data was fitted using the tight binding equation.

Figure S6. Substrate-binding titrations for CYP154C5 Q398A using steroid substrates A: pregnenolone (1), B: dehydroepiandrosterone (2), C: progesterone (3), D: androstenedione (4) and $\mathbf{E}$ : testosterone (5). $\Delta \mathrm{A}$ was plotted against the applied steroid concentration and the resulting data was fitted using the tight binding equation. Red dots represent data points that were not included in the fitting.

Figure S7. Substrate titrations for $K_{D}$ determination. The following enzyme-substrate combinations resulted only in a partial or no spectral shift upon substrate addition: (A) CYP154C5 M84A with 1; (B) CYP154C5 M84A with 2; (C) CYP154C5 M84A with 3; (D) CYP154C5 M84A with 6; (E) CYP154C5 F92A with 1; (F) CYP154C5 F92A with $\mathbf{6}$ and (G) CYP154C5 WT with 9.

Table S2. Obtained conversion values for purified CYP154C5 wild type and mutants in the transformation of steroids 1-6 at $30^{\circ} \mathrm{C}$ after 8 h reaction time. Measurements were performed in duplicate.

|  | Conversion (\%) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Substrate | CYP154C5 | CYP154C5 <br> M84A | CYP154C5 <br> F92A | CYP154C5 <br> Q239A | CYP154C5 <br> Q398A |

## 4. CYP154C5 modeling and docking

## CpdI

Figure S8. Geometric definitions of a near attack conformation for P450-catalyzed hydroxylation. Of the P 450 , only the iron and the reactive oxygen atom of compound I are shown while of the substrate only the attacked hydrogen and carbon atom are shown. A conformation was scored to be a NAC if it displayed simultaneously a distance $\mathrm{d} \leq 2.72 \AA$, an angle $\theta_{1}$ of $100-140^{\circ}$, and an angle $\theta_{2}$ of $>140^{\circ}$.

Figure S9. The positional flexibility of the substrate progesterone (3) increases due to the F92A mutation in CYP154C5. For each complex, the RMSF was calculated from three independent MD simulations of each 22 ns .

Figure S10. Distance of the substrate's (3) hydrogen atoms to the oxygen of compound I in trajectory 2. Only the shortest distance (there are three methyl hydrogens at position 21) is shown at each timepoint. In this figure, the second out of three independent MD simulations is show (the first is shown in Figure 4 within the main manuscript, the third in Figure S11). A) Wild-type CYP154C5 with progesterone (3) bound. B) CYP154C5 F92A with progesterone (3) bound in the alternative orientation; C) CYP154C5 F92A with progesterone (3) bound in the native-like orientation.

Figure S11. Distance of the substrate's (3) hydrogen atoms to the oxygen of compound I in trajectory 3. Only the shortest distance is shown at each time-point. In this figure, the third out of three independent MD simulations is show (the first is shown in Figure 4, the second in Figure S10). A) Wild-type CYP154C5 with progesterone (3) bound. B) CYP154C5 F92A with progesterone (3) bound in the alternative orientation; C) CYP154C5 F92A with progesterone (3) bound in the native-like orientation.

B

Figure S12. Obtained steroid orientations and potential hydroxylation sites during docking of A) 3deoxydehydroepiandrosterone (10), B) $16 \alpha$-hydroxy-3-deoxydehydroepiandrosterone and C) $4 \beta$ -hydroxy-3-deoxydehydroepiandrosterone as substrates in CYP154C5 (as compound I model).

Figure S13. Distances of the substrate's (11) hydrogen atoms to the oxygen of compound I during MD simulation. Since significant differences were observed within the 10 individual MD trajectories, the results of all trajectories are shown individually.

## 5. Protein crystallography

Table S3. Data collection and refinement statistics for CYP154C5 co-crystallized with $5 \alpha$-androstan-3-one (11). Values in parentheses are for the highest resolution shell.

## 6. Product identification

## a. Conversion of progesterone (3) by CYP154C5 F92A

Figure S14. HPLC chromatogram of progesterone (3) conversion after 6 h reaction time catalyzed by CYP154C5 F92A. The peaks at 9.7 min and 4.3 min correspond to the substrate progesterone and the product $16 \alpha$-hydroxyprogesterone, respectively. The peak at 5.6 min represents a new product identified as 21-hydroxylated progesterone by NMR analysis.

21-hydroxyprogesterone (11-deoxycorticosterone) ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 5.76(\mathrm{~s}, 1 \mathrm{H})$, $4.30-4.14(\mathrm{~m}, 2 \mathrm{H}), 3.30(\mathrm{~s}, 1 \mathrm{H}), 2.55-2.18(\mathrm{~m}, 7 \mathrm{H}), 2.06(\mathrm{dt}, J=13.6,4.2,1 \mathrm{H}), 1.96(\mathrm{dd}, J=9.3$, $6.4,1 H), 1.89(\mathrm{ddt}, J=11.9,5.8,2.7,1 \mathrm{H}), 1.83-1.54(\mathrm{~m}, 6 \mathrm{H}), 1.21(\mathrm{~s}, 4 \mathrm{H}), 1.10(\mathrm{qt}, J=12.9,6.6$, $2 \mathrm{H}), 1.00(\mathrm{td}, J=11.3,4.0,1 \mathrm{H}), 0.91(\mathrm{t}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 0.85(\mathrm{dd}, J=13.4,6.2,1 \mathrm{H}), 0.72(\mathrm{~s}, 3 \mathrm{H})$. ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 210.2$ (20-C), 199.5 (3-C), 170.8 (5-C), 124.0 (4-C), 69.43 (21-C), 59.1 (17-C), 56.1 (14-C), 53.6 (9-C), 44.7 (13-C), 38.6 (10-C), 38.4 (12-C), 35.7 (8-C), 35.6 (1-C), 33.9 (2C), 32.7 (6-C), 31.9 (7-C), 24.5 (16-C), 22.9 (15-C), 20.9 (11-C), 17.3 (19-C), 13.5 (18-C).

Obtained NMR data of formed 11-deoxycorticosterone are consistent with previously published data. ${ }^{[1,2]}$
b. Conversion of ethioallocholane (9) by CYP154C5 WT

A

B

Figure S15. GC-MS result of ethioallocholane (9) conversion by CYP154C5. A: Chromatogram of reaction; B: MS of possible product peak at $\mathrm{RT}=5.9 \mathrm{~min}$ with a maximum molecular ion peak of $\mathrm{m} / \mathrm{z}$ $=258$, equivalent to $[\mathrm{M}]^{+}-2$. This likely corresponds to a hydroxylated product of 9 that undergoes water elimination during GC-MS measurement (which was already observed for other hydroxylated steroids previously).

## c. Conversion of 3-deoxydehydroepiandrosterone (10) by CYP154C5 WT

Figure S16. GC chromatogram (black) of 3-deoxydehydroepiandrosterone (10) conversion after 16 h catalysed by CYP154C5 wild type. For comparison, the GC chromatogram of the respective control reaction (magenta) lacking CYP154C5 is shown as well. The peak at 4.97 min corresponds to the substrate whereas the peaks at 5.8 to 6.6 min represent reaction products.

## Main product:

16 $\alpha$-hydroxy-3-deoxydehydroepiandrosterone ${ }^{1} \mathrm{H}-\mathrm{NMR}(600 \mathrm{MHz}, \mathrm{DMSO}): \delta 5.34(1 \mathrm{H}, \mathrm{d}, J=5.6$, $16-\mathrm{OH}), 5.26(1 \mathrm{H}, \mathrm{d}, J=5.1,6-\mathrm{H}), 4.21\left(1 \mathrm{H}, \mathrm{dd}, J_{d}=8.4, J_{d}=5.9,16-\beta \mathrm{H}\right), 2.22(1 \mathrm{H}, \mathrm{m}, 4 \alpha-\mathrm{H}), 2.05-$ $1.95(2 \mathrm{H}, \mathrm{m}, 4 \beta-\mathrm{H}$ and $7 \beta-\mathrm{H}), 1.91\left(1 \mathrm{H}, \mathrm{dt}, J_{i}=13.7, J_{d}=8.5,15 \beta-\mathrm{H}\right), 1.81(1 \mathrm{H}, \mathrm{d}, J=12.7,1 \alpha-\mathrm{H})$, $1.73-1.51(6 \mathrm{H}, \mathrm{m}, 2 \alpha-\mathrm{H}, 3 \beta-\mathrm{H}, 8 \beta-\mathrm{H}, 11 \alpha-\mathrm{H}, 12 \beta-\mathrm{H}$ and $15 \alpha-\mathrm{H}), 1.50-1.43(2 \mathrm{H}, \mathrm{m}, 2 \beta-\mathrm{H}$ and $14 \alpha-$ $\mathrm{H}), 1.39\left(1 \mathrm{H}, \mathrm{dq}, J_{q}=13.4, J_{d}=4.6,11 \beta-\mathrm{H}\right), 1.31-1.21(2 \mathrm{H}, \mathrm{m}, 7 \alpha-\mathrm{H}, 12 \alpha-\mathrm{H}), 1.14(1 \mathrm{H}, \mathrm{m}, 3 \alpha-\mathrm{H})$, $1.03-0.95(5 \mathrm{H}, \mathrm{m}, 1 \beta-\mathrm{H}, 9 \alpha-\mathrm{H}$ and $19-\mathrm{Me}), 0.86(3 \mathrm{H}, \mathrm{m}, 18-\mathrm{Me}) .{ }^{13} \mathrm{C}-\mathrm{NMR}(150 \mathrm{MHz}, \mathrm{DMSO}): \delta$ 118.9 (6-C), 70.6 (16-C), 50.6 (9-C), 48.7 (14-C), 47.2 (13-C), 39.4 (1-C), 37.6 (10-C), 32.8 ( $4-\mathrm{C}$ ), 32.1 (7-C), 31.8 (12-C), 31.3 ( $8-\mathrm{C}$ ), 30.5 (15-C), 27.9 (3-C), 22.5 (2-C), 19.8 (11-C), 19.7 (19-C), 14.3 (18-C). HRMS (EI+): $m / z$ found: 288.20791 ( $\mathrm{m} / \mathrm{z}$ calculated for $\mathrm{C}_{19} \mathrm{H}_{28} \mathrm{O}_{2}$ : 288.2089).

C

D

Figure S17. NMR spectra of $16 \alpha$-hydroxy-3-deoxydehydroepiandrosterone; A: ${ }^{1} \mathrm{H}, \mathbf{B}:{ }^{13} \mathrm{C}, \mathbf{C}$ : DEPT135, D: COSY, E: HSQC, F: NOESY.

## Additional 3-deoxydehydroepiandrosterone product:

GC-MS analysis of the product gave a peak with $\mathrm{RT}=8.7$ min with a maximum molecular ion peak of $\mathrm{m} / \mathrm{z}=304$, equivalent to $[\mathrm{M}]^{+}+32$ (Figure S18). This result suggests a possible double hydroxylation of substrate $\mathbf{1 0}$. This is consistent with the obtained ${ }^{1} \mathrm{H}-\mathrm{NMR}$ data showing two different hydroxylation signals at 4.42 and 4.05 ppm (Figure S19A). Additionally, using HSQC-NMR analysis, these two proton signals were found to couple with carbon signals at 71.7 and 66.5 ppm corresponding to $\underline{\mathrm{CH}}-\mathrm{OH}$ (Figure S19B). Unfortunately, further structure elucidation was not possible due to the low amounts of purified product and, hence, a low resolution of the NMR spectra. HRMS (EI+) measurement gave $m / z$ of $304.20201\left(m / z\right.$ calculated for $\left.\mathrm{C}_{19} \mathrm{H}_{28} \mathrm{O}_{3}: 304.2038\right)$ consistent with two hydroxylation sites.

Figure S19. NMR spectra of the dihydroxy-3-deoxydehydroepiandrosterone product; A: ${ }^{1} \mathrm{H}, \mathbf{B}$ : HSQC.

## d. Conversion of $5 \alpha$-androstan-3-one (11) by CYP154C5 WT

Figure S20. GC chromatogram (black) of $5 \alpha$-androstan-3-one (11) conversion after 16 h catalysed by CYP154C5 wild type. The peak at 5.37 min corresponds to the substrate and the formed product eluted at 8.24 min . For comparison, the GC chromatogram of the respective control reaction (magenta) lacking CYP154C5 is shown as well.

## Assignment of the hydroxylation product according to NMR measurements

The ${ }^{1} \mathrm{H}$-NMR spectrum of the product shows one signal at 4.5 ppm , corresponding to the proton at a hydroxylated carbon atom. Moreover, in the respective ${ }^{13} \mathrm{C}$-NMR spectrum, signals for C 15 and C16 of the hydroxylation product are shifted significantly low-field compared to substrate 11, indicating that the hydroxylation had occurred at one of these carbons. According to HSQC and ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}-\mathrm{COSY}$ spectra, the proton signal at 4.5 ppm was found to couple with the carbon signal at 71.6 ppm as well as with proton signals at $1.18,1.7$ and 2.1 ppm . Based on the ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$-COSY spectrum in combination with the HSQC spectrum as well as comparison with NMR data of the substrate, these proton signals could be assigned to correspond to $14-\mathrm{H}$, one $17-\mathrm{H}$ and one $16-\mathrm{H}$, respectively. Hence, the hydroxylation site was concluded to be C 15 . The fact that the $15-\mathrm{H}$ coupled only with one $16-\mathrm{H}$ is in agreement with the Karplus relation, meaning that the coupling with the other $16-\mathrm{H}$ reaches zero if the dihedral angle between both protons approaches $90^{\circ}$. Instead, a long-range coupling with one $17-\mathrm{H}$ is observed, which is well-known for 5 -membered rings. In the NOESY spectrum of this compound, only a cross peak of the $15-\mathrm{H}$ signal with a multiplet from $1.67-1.77 \mathrm{ppm}$ is observed. This multiplet was assigned to correspond to signals of $7 \beta-\mathrm{H}, 12 \beta-\mathrm{H}$ and $17 \beta-\mathrm{H}$ according to $\mathrm{HSQC},{ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}-\mathrm{COSY}$ and NOESY spectra. Accordingly, the $15-\mathrm{H}$ at 4.5 ppm was concluded to have $\beta$-orientation as well. This means that the hydroxyl group at C15 will have $\alpha$-orientation, which is in agreement with obtained structural data of CYP154C5 in complex with steroid $\mathbf{1 1}$ as well as results from MD simulation.

15 $\alpha$-hydroxy- $\mathbf{5 \alpha}$-androstan-3-one ${ }^{1} \mathrm{H}$-NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 4.50(1 \mathrm{H}, \mathrm{m}, 15 \beta-\mathrm{H}), 2.45-2.23$ ( $2 \mathrm{H}, \mathrm{m}, 2 \alpha-\mathrm{H}, 2 \beta-\mathrm{H}$ ), $2.29\left(1 \mathrm{H}, \mathrm{t}, J_{t}=14.3,4 \alpha-\mathrm{H}\right), 2.14-2.06(2 \mathrm{H}, \mathrm{m}, 4 \beta-\mathrm{H}, 16 \alpha-\mathrm{H}), 2.04\left(1 \mathrm{H}, \mathrm{dq}, J_{q}=\right.$ $\left.6.8 J_{d}=2.3,1 \alpha-\mathrm{H}\right), 1.77-1.53(6 \mathrm{H}, \mathrm{m}, 5 \alpha-\mathrm{H}, 7 \beta-\mathrm{H}, 11-\mathrm{H}, 12 \beta-\mathrm{H}, 17 \alpha-\mathrm{H}, 17 \beta-\mathrm{H}), 1.44-1.25(7 \mathrm{H}, \mathrm{m}$, $1 \beta-\mathrm{H}, 6 \alpha-\mathrm{H}, 6 \beta-\mathrm{H}, 8 \beta-\mathrm{H}, 11-\mathrm{H}, 12 \alpha-\mathrm{H}, 16 \beta-\mathrm{H}), 1.18\left(1 \mathrm{H}, \mathrm{dd}, J_{d}=12.5 J_{d}=5.9,14 \alpha-\mathrm{H}\right), 1.06-0.98$ $\left(4 \mathrm{H}, \mathrm{m}, 7 \alpha-\mathrm{H}, 19-\mathrm{CH}_{3}\right), 0.85(1 \mathrm{H}, \mathrm{m}, 9 \alpha-\mathrm{H}), 0.75\left(3 \mathrm{H}, \mathrm{s}, 18-\mathrm{CH}_{3}\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(150 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ 211.2 (3-C), 71.7 (15-C), 54.0 ( $9-\mathrm{C}), 52$ (14-C), 52 (16-C), 46.6 ( $5-\mathrm{C}), 44.7$ ( $4-\mathrm{C}$ ), 41.9 (13-C), 38.6 (1-C), 38.5 (2-C), 38.2 (12-C), 37.3 (17-C), 35.8 (10-C), 35.2 (8-C), 31.9 (7-C), 28.9 (6-C), 21.1 (11-
C), 18.7 (19-C), 11.5 (18-C). HRMS (EI+): $m / z$ found: $290.22346\left(\mathrm{~m} / \mathrm{z}\right.$ calculated for $\mathrm{C}_{19} \mathrm{H}_{30} \mathrm{O}_{2}$ : 288.2246).
